

ARCHAEOLOGY AT A GLANCE

Introduction to Anthropology

Theory & Methods in Archaeology

Reconstructing the Human Past

Indigenous Archaeology

Excavating in the Arroyo Pesquero, Gulf Coast of Mexico

ARCHAEOLOGY

PART OF THE ANTHROPOLOGY PROGRAM

ANTHRO 103 - Archaeology: Reconstructing The Human

Past examines the theories and methods of archaeology as a practice for understanding the human experience, past, present, and future. Students learn about the colonial history of archaeology and its modern multi-discipline approach. Topics covered include excavation methods, laboratory techniques, reconstructing the human past, and ethical practices in archaeology. The class incorporates hands-on practicums and service learning projects where students prepare and make food, pottery, stone tools (lithics), clothing, medicines, and expressive materials. In the process, students create materials that serve as gifts, educational relics, and healing tools. By taking this approach, students create Indigenous modes of archaeology, often left out of the White/Eurocentric school of anthropology.
